

In many countries, large infrastructure projects are increasingly funded and managed by private companies rather than governments.
To what extent do you think this is a positive or negative development?

It is said that in many countries, private companies are increasingly managing and funding large infrastructure projects rather than governments. I firmly agree that this is a good idea, mainly due to financial issues.

Allocate more budget: governments are occupied with a large amount of work and funding in different fields > BECAUSE: large infrastructure projects require a large amount of budget allocation > governments may not be able to allocate a large amount of budget for large infrastructure projects > BECAUSE: private companies have limited investment projects > they are able to allocate a larger amount of money > significant impact on infrastructure projects improvement and development

Big influence on specialization: each private company has its own area of expertise > they have better professional knowledge and specialized experience than governments > they can manage large infrastructure projects professionally > the final outcome is likely to be better

Concede: governments have enough money > they are able to fund and manage private companies

More important: allocate their budget to poor people

It is said that in many countries, private companies are increasingly managing and funding large infrastructure projects rather than governments. I firmly agree that this is a good idea, mainly due to financial issues. ✓

One reason is that private companies are able to allocate more budget to large infrastructure projects. Nowadays, governments are occupied with a heavy workload and funding in different fields. Since large infrastructure projects require a large amount of huge budget allocation, governments may not be able to allocate large enough budgets to them. Private companies have limited investment projects, which are able to fund and manage large

Commented [ET1]: Such as?

infrastructure projects. Consequently, private companies would have a significant impact on infrastructure improvement and development.

In addition, if private companies fund large infrastructure projects, they may have a significant influence on specialization. In today's world, each private company has its own area of expertise, so ~~they have it has~~ better professional knowledge and specialized experience than governments. Hence, ~~they are it is~~ able to manage large infrastructure projects professionally, and the final outcome is likely to be better.

Commented [ET2]: Such as?

Some people argue that, since governments are among the most powerful organizations in each society, they have enough money to allocate ~~for to~~ large infrastructure projects.

However, in my opinion, ~~governments they~~ should prioritize other responsibilities in order to make a bigger impact on society. As far as I am concerned, it is better for them to allocate their money to poor people, such as donating their money to charities or building schools and hospitals.

In conclusion, since large infrastructure projects are increasingly funded and managed by private companies rather than governments, they are highly likely to be improved because ~~private~~ companies can allocate ~~more larger~~ budgets to their development and specialization.

TR 7	<u>The topic and your opinion have been presented very clearly, and the position is very clear throughout the essay. The main ideas (large enough budgets, specialization) have been presented clearly and explained relatively well, although there is a lack of examples that could help clarify and support your ideas. The counterargument almost exactly repeats the first main idea. It must be replaced with a completely different idea that has no overlap with the two you gave in the first and second body paragraphs.</u>
CC 6	<u>Coherence: The fourth paragraph returns to the idea of allocating large enough budgets. This makes paragraphing and progression faulty.</u> <u>Cohesion: Linking inside and between sentences is great. However, there is a lot of repetition because of the underuse of referencing and substitution (pronouns, synonyms and eliminations). See the model paragraph below this table for an example of how you can fix this easily.</u>

One reason is that private companies are able to allocate larger budgets. Nowadays, governments are occupied with heavy workloads and funding in different fields, such as healthcare, construction, transportation and defense. Since large infrastructure projects require huge budgets, they may not be able to allocate enough money to them. Companies have limited investment projects, which are able to fund and manage such projects. Consequently, they would have a significant impact on infrastructure improvement and development.

In addition, if companies fund projects, they may have a significant influence on specialization. In today's world, each private company has its own area of expertise, such as advertisement, public transportation, architecture, and urbanism, so ~~they have it has~~ better professional knowledge and specialized experience than governments/the government. Hence, ~~they are it is~~ able to manage ~~them~~infrastructure projects professionally, and the final outcome is likely to be better.
