

Access to clean water is a basic human right. Therefore every home should have a water supply that is provided free of charge.

Do you agree or disagree?

Admittedly, one of the most vital elements in human life is water, utilized for drinking and hygiene. Some people argue that water ought to be provided for all people for free because of its importance. In my opinion, it seems illogical~~ly~~ that every home enjoys free water.

Some people are proponents of free water. We cannot overlook needs for water from drinking and cooking to maintaining personal hygiene. When fresh water turn~~s~~ into an expensive commodity and many families could not afford to meet this need, it can encourage disadvantaged people to use unsafe water sources. This can have serious consequences such as diseases, which result in exerting pressure ~~in-on~~ healthcare systems with exorbitant cost~~s~~ for ~~authority~~authorities. Thus, the price of water should not be so expensive that people are enticed to use unsafe water sources.

Lack of fresh water has been an obvious issue over the past decades. In addition, water consumption ~~does-is~~ not restrict~~ed~~ to homes and human~~s~~. Water also plays a critical role in industry and it is essential for ~~the wild life~~wildlife. One of the most efficient approaches to ~~manage~~managing this issue is pricing. First, the distribution of clean water needs suitable infrastructure, and sometimes refinement is necessary for transport~~ing~~ potable water from one area to another. ~~These processes cost~~ The costs of these processes are not insignificant. Therefore, government~~s~~ need money to deal with these. Moreover, free water can encourage ~~people to~~ overconsumption. When water is free, a lot of people use it thoughtlessly. Even people will be reluctant to pay attention to ~~their home circumstances~~ the conditions of the houses. Sometimes some rudimentary measures for repairing outdated pipes and taps can hinder substantial water loss. When water is free, this kind of problem does not draw attention adequately.

In conclusion, nowadays we are struggling with lack of water resources and authorities should adopt appropriate approaches ~~that one of them~~, one of which is pricing~~g~~. Moreover, free water can tempt people to ~~overconsumption~~overconsume. Therefore, water pricing seems a rational measure.

Free water supplies can exacerbate the water shortage that has been an obvious issue over the past decades. When it is free, a lot of people would use it thoughtlessly, which can encourage overconsumption. Even people will be reluctant to pay attention to the conditions of their houses, and neglect some rudimentary measures for repairing outdated pipes and taps which can hinder substantial water loss. As a result, more water is wasted and less remains for future uses.
