

It is a natural process that animal species such as dinosaurs become extinct. There is no reason for people to prevent this from happening.
Do you agree or disagree?

While some people say that it is a natural process for animal species like dinosaurs to become extinct and there is no reason for individuals to prevent this from happening, I firmly disagree with this opinion, mainly because extinction can have negative effects on other species and future generations.

One reason is that extinction can damage the balance of nature. Since most animals are hunters and eat each other, the extinction of one species can affect other animals. For example, in wildlife, cats eat mice. If mice become extinct, the number of cats may decrease because they have less food. As a result, the population of other species can also change, which can disturb the balance of nature. Therefore, preventing the extinction of animals can help maintain the balance of nature and protect other species.

Furthermore, future generations may lose the chance to study and see animals that may become extinct. Studying them plays an important role in the educational system because individuals, especially younger people, can learn about animals such as rhinos, lions, elephants, and giraffes. Seeing them can also be a form of entertainment. Many tourists nowadays visit zoos and have different experiences there. If there are fewer spectacular animals to see, people may lose an important form of entertainment. For instance, future

This means preventing the extinction of other animals can help...

generations may only be able to see these animals in pictures or fossils rather than seeing them in real life.

Commented [ET3]: This does not exemplify the sentence before it.

Some people believe that extinction is a natural process and people should pay attention to more important issues. However, in my opinion, preventing extinction has a positive influence on the environment because it helps maintain biodiversity. ~~In conclusion~~Therefore, since extinction can have negative effects on other species and cause future generations to lose the chance to study and see animals, people should prevent ~~this~~it from happening.

Commented [ET4]: These ideas do not respond to the issues raised in the counter-argument (natural process + more important issues). Fix:

Some may argue that extinction is a natural process, but I believe in many cases it is the result of human activities such as deforestation that can be prevented.
