

Many scientists believe that seeking out life by sending messages into space is a good idea while others feel that it is dangerous. Discuss both views and give your opinion.

Whereas many scientists think that seeking out life by sending messages into space is a good idea, others feel that it is dangerous. In this essay, I will discuss both views, before explaining why I strongly believe that it could be dangerous for people's lives. ✓

On the one hand, people may eventually be able to live on other planets. Since the population on Earth is increasing, the number of houses is rising, so there is less ~~available~~ space available for constructing new buildings, ~~as a result of which~~. In the future people may need to find new places to live ~~in the future. If, and if~~ scientists send messages to seek out life, they may discover possibilities for space colonization on other planets. In addition, scientists may discover natural resources, such as water, gas, gold and silver. Since the resources on Earth are decreasing, people may not be able to find enough of them in the future. For example, if scientists discover enough water on another planet, this could provide an additional source of water for humans.

On the other hand, because the universe has lots of unknown creatures, scientists and researchers are likely to discover new species, ~~which that~~ may be dangerous for people's lives. For instance, ~~if these creatures are dangerous~~, they may want to eat or kill humans. Furthermore, sending messages into space may show other creatures where humans live. If

Commented [ET1]: The task is not about space discoveries. It is about sending messages to find alien civilizations. This idea has not been linked to the topic in any way.

Commented [ET2]: Repetitive and redundant

they receive scientist’s messages, they may learn about the Earth and humans. As a result, they may come to the Earth and put people’s lives in danger. For example, they may have advanced weapons and attack the Earth to live on it.

In conclusion, although sending messages into space may help scientists discover new places and natural resources, I strongly believe that seeking out life ~~by sending messages into space~~ [in this way](#) is dangerous mainly because scientists may discover dangerous creatures that may learn about the existence of humans and put people’s lives in danger.
